

# ProcFS Overview

Created & Presented By: Janvi

# Introduction

/proc is one of the filesystem which is also called as a process information pseudo-file system. It doesn't contains the 'real' files but runtime system information i.e system memory , devices mounted , hardware configuration and more. A lot of system utilities are mainly call to the files in this directory.

The file size of all of the files in this directory have a file size of 0, with just exception of some files.

The directory name is /proc

You can go into the directory by doing `cd /proc`

These are the files present in the proc directory.

All the numbered files are the Process ID running itself.

```
janvi@janvi-VirtualBox:/proc$ ls
1      1268    14571   1622    25     338     771    asound      locks
10     1273    14579   1631    259    339     779    bootconfig  mdstat
100    1292    14587   1632    26     3573    780    buddyinfo   meminfo
101    1299    1469    1636    266    3591    781    bus          misc
102    13      1492    1642    27     4       782    cgroups     modules
10244  1304    1496    1644    275    546     786    cmdline     mounts
10288  13042   1497    1647    276    547     79     consoles   mtrr
103    1308    15      1662    277    579     792    cpuinfo     net

```

All these files are having the size 0. But what these contain the information and how it contains information is that these files don't contain any sort of data, it just acts as a pointer to where the actual process are running. For example, I am just portraying one of the process ID files here. These are the files that are present in one of the Process ID directory.

```
janvi@janvi-VirtualBox:/proc/620$ ls
ls: cannot read symbolic link 'cwd': Permission denied
ls: cannot read symbolic link 'root': Permission denied
ls: cannot read symbolic link 'exe': Permission denied
arch_status      cwd              mem              patch_state      stat
attr             environ         mountinfo        personality      statm
autogroup        exe             mounts           projid_map       status
auxv             fd              mountstats       root             syscall
cgroup          fdinfo          net              sched             task
clear_refs      gid_map         ns               schedstat        timens_offsets
cmdline         io              numa_maps        sessionid         timers
comm            limits          oom_adj          setgroups         timerslack_ns
coredump_filter loginuid         oom_score        smaps             uid_map
cpu_resctrl_groups map_files        oom_score_adj    smaps_rollup     wchan
cpuset          maps            pagemap          stack
```

All the files present in any of process id is there because of some purpose and contents that each of the file serve there. I am going to explain a few:

- cmdline - command line arguments
- cpu - current & the last cpu that was executed.
- cwd - path to the current working directory (Required root permission))
- environ - environment variables value
- exe - link to the executable of that particular process.
- mem - memory held by this process
- stat - status of the process
- statm - memory status information
- maps - memory maps to executables and library files.

These are some of the files and to get to know about more , we can refer to the man page of the proc.

```
janvi@janvi-VirtualBox:/proc/620$ cat status
```

# Kernel data

Kernel Data files give the information about the running kernel . The files that will be present on the system can vary from the system to system as these files depend on the kernel configuration and the loaded modules .

Kernel info in /proc is stored in the files like :

- apm - advanced power management information
- buddyinfo - Kernel memory allocator information
- bus - Directory containing bus specific information
- cmdline - Kernel command line
- cpuinfo - Info about the CPU
- devices - available devices
- dma - Used DMS channels
- filesystems - supported filesystems
- driver - various drivers

- fb - FrameBuffer Devices
- Fs - file system parameters like ext4 , nfs and jbgd
- ide - info about the IDE subsystem
- Interrupts- interrupt usage
- iomem - Memory map
- ioports - i/o port usage
- Irq - irq to cpu affinity
- Kcore - kernel core image
- Kmsg - kernel msgs
- Ksyms - kernel symbol table
- locks - kernel locks
- meminfo - memory info
- modules - loaded modules
- net - networking info
- pagetypeinfo -Additional Page allocator information
- partitions - table of partition known to the system

- pci - Deprecated info of PCI bus (new way -> /proc/bus/pci/, decoupled by lspci)
- rtc - Real time clock
- scsi - SCSI info (see text)
- slabinfo - Slab pool info
- softirqs - softirq usage
- stat - Overall statistics
- swaps - Swap space utilization
- sysvipc - Info of SysVIPC Resources (msg, sem, shm)
- tty - Info of tty drivers
- uptime - Wall clock since boot, combined idle time of all cpus
- version - Kernel version
- video - bttv info of video resources
- vmallocinfo - Show vmallocated areas

# IDE Devices in /proc/ide

This subdirectory /proc/ide contains information about all the IDE devices of which that particular kernel is aware. There is one subdirectory for each IDE controller , the file driver and a link to the IDE Device that points to the device directory in the controller specific subtree.

The file “ drivers” one contain the information about the drivers used for the IDE devices.

The subdirectory contains more information that can be found in the IDE controller . These are named ide0, ide1 and so on. IDE controller consists of info about these things:

- Channel - IDE channel
- Config - configuration
- Mate - mate name
- Model - type/chipset of the IDE controller

The devices which are connected to these controller have separate subdirectories which consists of various files :

- cache - stores the cache
- capacity - capacity of the medium
- driver - file driver and the version
- geometry - physical and logical geometry of the device
- Identify - device identify block
- Media- media type
- Model - device identifier
- Settings - service setup
- smart\_thresholds - ide disk management thresholds
- smart\_values - ide disk management values

## Kernel Data info file

loadavg  
locks  
mdstat  
meminfo

# meminfo

```
janvi@janvi-VirtualBox:/proc$ cat meminfo
```

```
MemTotal:      2811644 kB
MemFree:       140276 kB
MemAvailable:  972408 kB
Buffers:       46272 kB
Cached:        890376 kB
SwapCached:    5452 kB
Active:        894652 kB
Inactive:      1553536 kB
Active(anon):  394340 kB
Inactive(anon): 1127532 kB
Active(file):  500312 kB
Inactive(file): 426004 kB
Unevictable:   16 kB
Mlocked:      16 kB
SwapTotal:    459260 kB
SwapFree:     2844 kB
Dirty:        948 kB
```

- MemTotal - Total Usage RAM
- MemFree - total sum of HighFree+LowFree
- MemAvailable - available memory for starting the new application.
- Buffers- Temporary storage
- Cached - in-memory cache for files.
- SwapCached - Memory that was once swapped out.
- Active -Memory used recently
- Inactive -memory used less recently
- HighTotal/Free -above ~860mb of physical memory.
- LowTotal/Free - which can be used for everything
- SwapTotal - total amount of swap space available
- SwapFree - memory evicted from the RAM
- Dirty - memory waiting to get written back to disk.

```

Writeback:                0 kB
AnonPages:               1500296 kB
Mapped:                  280844 kB
Shmem:                   13592 kB

WritebackTmp:            0 kB
CommitLimit:             1865080 kB
Committed_AS:            5983560 kB
VmallocTotal:           34359738367 kB
VmallocUsed:              38600 kB
VmallocChunk:             0 kB
Percpu:                  1856 kB
HardwareCorrupted:       0 kB
AnonHugePages:           8192 kB
ShmemHugePages:          0 kB
ShmemPmdMapped:          0 kB
FileHugePages:           0 kB

```

- **Writeback** Memory which is actively being written back to the disk
- **AnonPages** Non-file backed pages mapped into userspace page tables
- **HardwareCorrupted** The amount of RAM/memory in KB, the kernel identifies as corrupted.
- **AnonHugePages** Non-file backed huge pages mapped into user space page tables
- **Mapped** files which have been mapped, such as libraries
- **Shmem** Total memory used by shared memory (shmem) and tmpfs
- **ShmemHugePages** Memory used by shared memory (shmem) and tmpfs allocated with huge pages
- **ShmemPmdMapped** Shared memory mapped into userspace with huge pages
- **KReclaimable** Kernel allocations that the kernel will attempt to reclaim under memory pressure. Includes SReclaimable (below), and other direct allocations with a shrinker.
- **Slab** in-kernel data structures cache
- **SReclaimable** Part of Slab, that might be reclaimed, such as caches
- **SUnreclaim** Part of Slab, that cannot be reclaimed on memory pressure
- **PageTables** amount of memory dedicated to the lowest level of page tables.
- **NFS\_Unstable** Always zero. Previous counted pages which had been written to the server, but has not been committed to stable storage.
- **Bounce** Memory used for block device “bounce buffers”
- **WritebackTmp** Memory used by FUSE for temporary writeback buffers
- **CommitLimit** this is the total amount of memory currently available to be allocated on the system.
- **Committed\_AS** the amount of memory presently allocated on the system.
- **mallocTotal** total size of vmalloc memory area
- **VmallocUsed** amount of vmalloc area which is used
- **VmallocChunk** largest contiguous block of vmalloc area which is free
- **Percpu** Memory allocated to the percpu allocator used to back percpu allocations. This stat excludes the cost of metadata.

## Softirqs:

Count of softirq handlers services for each CPU.

```
janvi@janvi-VirtualBox:/proc$ cat softirqs
```

	CPU0	CPU1
HI:	21	1
TIMER:	690655	13647821
NET_TX:	1577	9208
NET_RX:	142603	239324

icmp6         ip_tables_targets raw           stat
if_inet6      ipv6_route    raw6          tcp
```

IPv6 info is present in the directory in the files:

- udp6 - UDP sockets (ipv6)
- tcp6 - TCP sockets
- raw6 - Raw device statistics
- igmp6 - IP multicast addresses which is joined by the host.
- If\_inet6 - List of IPv6 interface addresses
- Ipv6\_route Kernel routing table for IPv6
- Rt6\_stats - Routing Statistics
- sockstat6 - Socket Statistics
- snmp6 - Snmp Data

Files that provide the Network information are:

- Arp- Kernel ARP table
- dev - network devices with statistics
- dev\_mcast - multicast group
- dev\_stat- network device status
- netstat- network statistics
- raw- raw device statistics
- route - kernel routing table
- rt\_cache - Routing cache
- unix - unix domain sockets
- wireless - wireless interface data
- netlink - list of PF-NETLINK sockets
- Ip\_mr\_vifs - List of multicast virtual interfaces
- psched- packet scheduler parameter

# SCSI Info

The primary file in this directory is the `scsi` which contains a list of every recognized scsi device. We can get to know about the model , type of device , vendor , scsi channel and ID data .

```
janvi@janvi-VirtualBox:/proc$ cd scsi
janvi@janvi-VirtualBox:/proc/scsi$ ls
device_info  scsi  sg
janvi@janvi-VirtualBox:/proc/scsi$ cat /proc/scsi/scsi
Attached devices:
Host: scsi1 Channel: 00 Id: 00 Lun: 00
  Vendor: VBOX      Model: CD-ROM          Rev: 1.0

# Parallel Port

Parallel port includes the ability to share one port between multiple device drivers.

This directory contains information about the parallel ports of your system.

`/proc/parport`

Files included:

- `autoprobe`: Device ID information that has been acquired.
- `devices` : list of the device drivers that are using that port. A + will appear by the name of the device currently using the port.
- `hardware`: Parallel port;s base address
- `irq`: IRQ number that passport is using for that port.

# TTY info in /proc/tty

TTY is basically an abstract device. It can be referred to as input device such as a serial port or a virtual teletype where it allows users to interact with the system.

This consist information about the available and actually used tty's.

This consist of files for :

- Drivers: list of drivers and their usage.
- ldiscs : registered line disciplines
- driver/serial : usage statistic and status of single tty lines.

```
janvi@janvi-VirtualBox:/proc$ cd tty
janvi@janvi-VirtualBox:/proc/tty$ ls
driver  drivers  ldisc  ldiscs
janvi@janvi-VirtualBox:/proc/tty$ cat drivers
/dev/tty          /dev/tty          5          0 system:/dev/tty
/dev/console      /dev/console      5          1 system:console
/dev/ptmx         /dev/ptmx         5          2 system
/dev/vc/0         /dev/vc/0         4          0 system:vtmaster
ttyprintk        /dev/ttyprintk    5          3 console
max310x          /dev/ttyMAX       204 209-224 serial
serial           /dev/ttyS         4 64-111 serial
pty_slave        /dev/pts          136 0-1048575 pty:slave
pty_master       /dev/ptm          128 0-1048575 pty:master
unknown          /dev/tty          4 1-63 console
janvi@janvi-VirtualBox:/proc/tty$ cat ldiscs
n_tty            0
n_null           27
```

# /proc/consoles

This shows registered console line.

```
janvi@janvi-VirtualBox:/proc$ cat consoles
tty0          -WU (EC p )    4:2
```

Here , the operations , flags and major:minor are the devices and to that we have various flags and operations attached to it.

- Operations: R- read operation , W - write operation , U - unblank
- Flags: E - enabled, C - preferred console , B - Primary Boot Console , p - printk buffer , b - braille device , a - safe to use.
- Major:minor : major and minor number of devices separated by a colon.

# Kernel Statistics in /proc/stat

Information about kernel activity are available in the `/proc/stat` file.

[illegible]

- ❖ CPU line: The stat files consists of columns that follows from left to right that shows the amount of time that the CPU has spent while performing these tasks.
  - user: normal processes executing in user mode
  - Nice:niced processes executing in user mode
  - system: processes that are executing in the kernel mode.
  - idle: twiddling thumbs
  - iowait: waiting for I/O to complete
  - irq: servicing interrupts
  - softirq: servicing softirqs
  - steal: involuntary wait
  - guest: running a normal guest
  - guest\_nice: running a niced guest

- ❖ `intr` = count of interrupts serviced since the boot time.
- ❖ `ctxt` = total number of context switches across all CPUs.
- ❖ `btime` = This gives the time at which the system booted.
- ❖ `processes` = number of processes and thread created .
- ❖ `procs_running` = total number of threads that are running or ready to run
- ❖ `procs_blocked` = number of processes that are currently blocked or waiting for the I/O to complete.
- ❖ `softirq` = count of softirqs serviced since boot time.

# /proc/fs or ext4 file system

/proc/fs consist of the directories and information about the ext4 , jbd2 and nsfd file systems.

Information about mounted ext4 file systems can be found in /proc/fs/ext4.

Jbd2 is the kernel thread of ext4 for updating journals and it is a resource for the ext4 file system. This is for the block journaling which deals with I/O operations and provides a way to check the data integrity.

nfsd - this is a special filesystem that is used for controlling the Linux NFS Server.

```
janvi@janvi-VirtualBox:/proc/fs/ext4$ cd sda5
janvi@janvi-VirtualBox:/proc/fs/ext4/sda5$ ls
es_shrinker_info  fc_info  mb_groups  mb_stats  mb_structs_summary  options
janvi@janvi-VirtualBox:/proc/fs/ext4/sda5$
```

```
janvi@janvi-VirtualBox:~$ cd /proc/fs
janvi@janvi-VirtualBox:/proc/fs$ ls
ext4  jbd2  nfsd
janvi@janvi-VirtualBox:/proc/fs$ cd ext4
janvi@janvi-VirtualBox:/proc/fs/ext4$ ls
sda5
janvi@janvi-VirtualBox:/proc/fs/ext4$ cd ..
janvi@janvi-VirtualBox:/proc/fs$ cd jbd2
janvi@janvi-VirtualBox:/proc/fs/jbd2$ ls
sda5-8
janvi@janvi-VirtualBox:/proc/fs/jbd2$ cd sda5-8
janvi@janvi-VirtualBox:/proc/fs/jbd2/sda5-8$ ls
info
janvi@janvi-VirtualBox:/proc/fs/jbd2/sda5-8$ cat info
7539 transactions (6980 requested), each up to 4096 blocks
average:
 0ms waiting for transaction
 0ms request delay
996ms running transaction
 0ms transaction was being locked
 0ms flushing data (in ordered mode)
 0ms logging transaction
1946us average transaction commit time
280 handles per transaction
 8 blocks per transaction
10 logged blocks per transaction
janvi@janvi-VirtualBox:/proc/fs/jbd2/sda5-8$ cd /proc/fs/nfsd
```
